1997 - 2002 Peak Hour Weekday Traffic Volumes

The listing of peak hour volumes is selected from traffic counts obtained with automatic traffic recorders over the past 6 years. The highest one hour volume for either direction of a count is recorded within the time periods 6:30 to 9:30 (AM peak) and 15:30 to 18:30 (PM peak), along with the opposing volume during the same time period. Where more than one day of count information is available, an average of all counts is listed.

Volumes listed are actual counts of axles divided by two. No adjustments are applied to correct for multi-axle trucks. No adjustments are made to reflect variations in day of week or time of year surveyed. Counts are typically collected between April and October. Volumes shown as dash "-" indicate no count was undertaken in that year.

This listing should be used for general information only. Volume differences between years may be misleading if used without backup information. Short term impediments on a congested roadway flatten the peak and shift volumes to the shoulders of the peak. Although the peak hour volume would be reduced in this example, the peak hour demand may be the same as in previous counts.

For further explanation of data presented, or for other traffic information, contact
